

Historical Bid Case 05 — Retail ERP and Data Transformation

IMPORTANT: This is a synthetic historical case created for the BidMemory hackathon demo. It is not a real client engagement or real procurement result.

Industry	Retail / Enterprise IT
RFP / Need	Modernize ERP workloads, integrate operational data and improve reporting across retail operations.
Outcome	Won (synthetic historical case for BidMemory testing).

Key Requirements

- Application and data migration
- Integration with existing systems
- Reporting and analytics
- Security and access control
- Business continuity and post-go-live support

Proposal Approach

- Started with application and dependency discovery.
- Defined migration waves around business-critical systems.
- Included data validation checkpoints and rollback procedures.
- Added a post-go-live stabilization period.

Client / Evaluator Feedback

- The dependency discovery and migration-wave structure increased confidence.
- Data validation checkpoints were useful.
- The proposal clearly separated implementation from stabilization support.

Lessons Learned for Future Bids

- For enterprise migrations, explicitly address dependencies and data validation.
- Separate implementation, cutover and stabilization activities.
- Use risk checkpoints before each migration wave.

Memory purpose: preserve the relationship between RFP requirements, proposal decisions, outcome, feedback and reusable lessons so BidMemory can retrieve and reflect on prior bid experience.
